
Setting the working Environment

Organization

Created an organization on GITHUB under the name "BiScooter"

Repo

Created a repo for the "BiScooter" organization called "BiScooter"

Project Structure

Inside the "BiScooter" repo directory, there are the following directories

- biscooter: the end user program application
- server: contains server side that connects the program with the Database
- db_queries: the queries used to build the Database, filling any necessary records, and set the constraints; this helps to have a way to rebuild any part of the Database again in case for any problem

biscooter

created by

```
flutter create biscooter
```

server

1 - first created app.js

2 - then initialized a new npm project by running the following command in the terminal

```
npm init
```

3 - installed the express dependency

```
npm install express
```

4- for easier development, installed the nodemon dependency

```
npm install --save-dev nodemon
```

5- created the best-practice file structure for a server; adding the following folders and filling them with dummy files

- controllers
- middleware
- routes
